Download From Zippyshare.com.Q: checkbox value in jquery I am using the code below to save a checkbox value into a database. if (\$('#b+j').prop("checked") == true) The problem is that when I run this I receive a javascript error because the checkbox that's being checked is inside an anchor. So basically the code should be: if (\$('#b+j').is("checked")) But since the code is in an anchor, I get a javascript error. How can I get around this? Thanks A: You're not checking for checked here: You should change this to: if (\$('#b+j').prop("checked")) Because you can't check for a boolean property, you must check for a truthy value. You can either use true or the constant true. The reason you're getting this error, is because you're attempting to use .prop on a jQuery object when the selector returned is a DOM Node. The program consists of interdisciplinary training for a graduate or advanced degree in public health. Its major objective is to assist trainees in gaining expertise in understanding and applying multidisciplinary and multiprofessional approaches to public health issues. The training focuses on the use of a social science perspective for the study of health and illness, the development of appropriate research designs, the application of appropriate research methods, and the synthesis of knowledge for the advancement of public health and practice. Graduates are expected to be proficient in developing and applying quantitative and qualitative approaches to problems of public health, particularly in epidemiology and in health services research. Specific areas of expertise will be in the areas of behavioral medicine, dental public health, environmental health, global health, health services research, epidemiology, health policy, health protection, immunization and bioterrorism, occupational health, public health administration, quality of life, toxicology, and violence prevention and control. A core curriculum, which includes courses in epidemiology, biostatistics, public health administration and policy, and economics, is required of all trainees. Additional training includes topics in mental health, aging, health services research, public policy, the design and analysis of randomized clinical trials, and statistics. The program is housed in the Department of Public Health Sciences in the School f3e1b5768c
