Microparticles, or microparticles, are small discrete entities derived from cells and are found in a number of biological fluids such as blood. The potential role of microparticles in normal and disease states is discussed and their clinical utility is reviewed. Particular attention is paid to their potential use as biomarkers for diagnosis of pathologies involving endothelial activation and dysfunction. The general methods used for isolation and characterisation of microparticles are outlined and applications of the properties of microparticles to their potential clinical use are discussed.1. Field of the Invention The present invention relates to a gate driving circuit, and more particularly, to a gate driving circuit used for a display apparatus. 2. Description of the Related Art An active matrix display apparatus is a display apparatus which uses a switching element as a switch means for driving a display panel. The driving method for the display apparatus is classified into a scan driving method and a refresh driving method. The scan driving method sequentially applies a driving pulse to a plurality of gate lines provided in the display panel in order to select a display cell at each scanning time. The refresh driving method repeatedly applies an instruction signal to a display panel and simultaneously drives all of the display cells in the display panel with a predetermined instruction signal. In general, the display apparatus with the above driving method uses a
