A comprehensive education in the matter of investment banking and the development of commercial mortgages. One of the most prestigious courses in Latin America. A: Try

changing your request to: GET /(?P\d+)-(?P.*?); This should return the data for the given filename and the given date.

Q: C# WinForm: Setting proper initialization on Run() I am new to C# and trying to figure out the proper way to initialize my form and data objects as the program runs. I am running the form on a button click. I am doing the following so far.

```
private void button1_Click(object sender, EventArgs e) { //Call the Run()
```

```
function form1.Run(); } private void  
form1_Load(object sender, EventArgs e) {  
}
```

What would be the proper way to call the
form1_Load() method to make the form
and data ready to go? A: The only thing I

could think of is doing it in the

Form1_Load event of the form. This way
the form should be set up by the time you

get to form1.Run() private void

```
Form1_Load(object sender, EventArgs e) {  
//This should be the code you use to set the  
form up... }
```
