I have tried everything on the first page of google, but nothing works.

I did a little research on this device and it has a dual sim card slot, and an USB Type-A port. I have never heard of a device with a USB Type-A port on the back of the device. It is not a lot, but it is enough to know that I do not need to worry about it. I can put another USB Type-C cable in to connect my computer directly to it and there should be no problems with the device. Thanks A: From reading a bit more about it, I found that there is a little problem that happens when the device has the USB charger plugged in and connected to the computer. In my case, the USB Type-C port on the back of the phone becomes completely useless. This is the data I found regarding it: [...] The USB charging port on the back of the Coolpad 8676 is a proprietary port, and it appears to not be a standard USB Type-A port (as a part of this patent filing, this is what it looks like). If you try to plug a standard USB Type-A charging cable into the Coolpad device, you will end up with no charging. If you try to charge the device using the built-in charger, you will notice a LED light on the back of the device turn blue. Source: In my case, I did not have a regular USB Type-A cable (one that is white) to try, but I do have a "neutral" cable with a USB Type-A plug on it. I tried that and was able to charge the device without problems. It is not a perfect solution, but at least it will work in most cases, and in any case it will be a better solution than it is now. 2d92ce491b
