between the two databases, but most of the statistics are significantly different. This is mostly due to the various numbers of patients (ranging from 1299 for BRMS1 to 1182 for BRMS2), the overall length of the unlisted genes, and the various numbers of overlapping gene lists (ranging from a minimum of 143 for BRMS1 to a maximum of 201 for BRMS2). In our case, we found a minimum of 2 genes for BRMS1 and 1 gene for BRMS2.

Considering the increasing numbers of known breast cancer

genes, we can envision that the information provided by this work might evolve with the ongoing progress in this field. We also collected genes that can be found in the KEGG pathway database. Again, our list of genes is clearly dominated by GPR30 and the *ErbB* receptor family. In total, we found 57 genes that can be mapped to KEGG pathways. Among them, the genes related to MAPK signaling and metabolic pathways seemed
