* **Tips to avoid common Photoshop mistakes:** The best way to learn how to use Photoshop is to experiment with it and make mistakes. If you make errors, such as trying to fix an object that you don't have access to or using a filter that's not properly calibrated, a helpful tool is the Quick Fix button (Q) to warn you before you make costly mistakes. * **How to use Photoshop:** Photoshop is made to accommodate a wide range of professional image needs. With this program, you can create professional photos from scratch or, if you're familiar with other programs such as PowerPoint, you can import and edit slide images or photos. To learn how to use Photoshop, turn to the chapters in Part 4. * **Adobe Photoshop tutorial resources:** There is no end of tutorials on the Internet to help users get started. Pick any topic that interests you, such as photo editing, and find great tutorials on it. * **Color modes:** The default color mode for Photoshop is RGB mode. But if you want to use grayscale images or simply use black, white, and shades of gray tones, you'll need to make that the default mode. In the Photoshop image adjustment and print dialog box, choose Grayscale from the Color Mode drop-down list to make it the default or alternately deselect the RGB check box in that list. This step is also known as `_switching to grayscale mode._` * **Layer and selection tools:** Layers are the building blocks of Photoshop. An image has one or more layers; when it's edited, the layers are moved, moved, and moved again, changing the original image into a new image. When you first open a Photoshop file, you see the thumbnail of your original image along with the Layers palette, which has a thumbnail image of each layer in the image. When you drag a layer from the Layers palette onto the Photoshop canvas, you create a `_new_` layer (add a new one). To rename a layer, click it in the Layers palette. To move a layer, click it and drag it to a new location in the image. To select an entire layer — that is, to place the layer over your selection in the image — click in the Layers palette to select it. Then select the Move tool on the toolbar and choose the layer that you want to move in the Layers palette. To move a layer, drag it to

A molecular analysis of the gamma-aminobutyric acid A subunit of neocortical GABAergic synapses reveals evidence for clustering of the subunit into distinct populations of synaptic sites. Because of the abundance of subunits of the gamma-aminobutyric acid (GABA)-gated chloride channel in the neocortex of primates and birds, it has been suggested that it may be essential for the development and function of neocortical inhibitory synapses. Therefore, to determine if there are differences in the pattern of distribution of the GABAA receptor subunits in the cortex, we used postembedding immunohistochemistry and compared the patterns of subunit staining in neocortical synapses in the parietal cortex of normal adult cats, rats and chickens. We used polyclonal anti-peptide antibodies against a synthetic peptide corresponding to the third intracellular loop of the alpha-1, beta and gamma-1, beta and gamma-2 and delta and theta subunits. Our results indicate the presence of distinct populations of synapses with the subunits at the synapse and with the dendritic shaft, which often displayed a nonhomogeneous distribution. The relative density of colocalization of subunits was highest in the parietal cortex of the cat. In the alvus and praei areas, only the gamma-2 subunit showed high levels of colocalization. In the primary motor, somatosensory and visual areas of the cat, colocalization of the subunits was particularly high in the superficial layers. Rats showed a more uniform distribution of the subunits, except the gamma-2 subunit, which showed a uniform, rather than a patchy, pattern of distribution in the deeper layers. Chickens showed the highest and most uniform levels of colocalization of the subunits. The pattern of immunolabeling was similar in cats and rats, but was more segregated in the chicken. The postembedding approach used in this study permitted a detailed analysis of the pattern of immunolabeling for the various subunits. Together, these data suggest that, in contrast to other areas of the cortex, glutamatergic synapses in the parietal area of the cortex contain the GABAA receptor subunits clustered in distinct populations of synaptic sites rather than distributed homogeneously within the dendritic arbor. Furthermore, the different distribution patterns of the subunits suggests that these receptor subunits may have distinct functions. I can already imagine

The Dodge and Burn tools let you lighten or darken parts of the image. The Dodge tool adds light and the Burn tool adds dark. The Smudge tool simulates a dirty brush, allowing you to soften edges and blends color smoothly. The Lasso tool allows you to draw freehand paths, select objects, and copy objects to any area. The Pen tool allows you to draw perfect lines or paths. The Pencil tool lets you draw lines in any color you wish, which is useful for illustrations, logos, or marking things like blemishes, lines, and text. The Gradient tool, popularly used for illustration purposes, helps you create gradients and blend colors. The Puppet Warp tool lets you move or stretch an object, simulating the effect of a cloth. The Rotate tool allows you to manipulate an object's perspective. The Perspective tool allows you to create perfect 3D shapes and objects by drawing objects in perspective. The Mirror tool allows you to flip, rotate, or skew an image. The Typography tool lets you create font effects and fonts in any color. The Crop tool lets you crop part of an image, which allows you to focus on important subject matter while cutting out unimportant parts of an image.
